***Please indicate which type of Akadama you are interested in. We will let you know whether it is currently available.**

When sold as a single substrate, we sieve only Golden Line (semi-fired Akadama) and Red Line (fired Akadama). We do not sieve Regular Akadama (Double Line) because it contains too much dust.

Regular Akadama (Double Line) is not available as a sieved single substrate. It is available in its original Japanese bags (see **Imported Substrates**, page 7) or as an ingredient in our sieved substrate mixes.

2. GENERAL SIEVED MIXES:

MIX AKADAMA 50% / PUMICE (BIMS) 50% FOR NEEDLE TREES (16 LITERS BAG)

Package/Price	1kg – 19€	2kg - 24€	4kg - 39€
Order:			

IBUKI Tamahi organic fertilizer pellets.

They are solid, dry, and put in shape. Soy, bone meal, fish meal, rapeseed, krill and oyser shells, minerals and rice bran gone through the fermentation process and dried to take the form of pellets that is used in the top bonsai nurseries in Japan for decades. This fertilizer is used for bonsai trees because it sustains its effectiveness without dissolving quickly. It is totally safe as you cannot over fertilize, your bonsai will take nutrition as much as it requires.

Complete fertilizer for strong growth. Provides a vital and healthy bonsai. For both young and old outdoor bonsai, yamadori and shohin.

Usage:

Place for every 50mm pot length 1 – 2 pellets on the soil. The pellets may be pushed into the ground a bit. Keep Tamahi moist to get the best result through good Bonsai watering practices. The granules can also be put in a fertilizer basket with some sphagnum moss or tea bags.

Nitrogen in the Tamahi will be effective for 4-6 weeks, however the other elements will be effective for much longer. Apply new pellets after 4-5 weeks however leave the old ones for as long as possible to get the full benefit from Potassium, Phosphorous and other elements.

Fertilizer application and protection:

We provide fertilizer bags and baskets for the fertilizer at our internet shop that help a lot with the placement of the fertilizer on top of the substrate.

Last application of Summer Tamahi – beginning of September

First application of Autumn Tamahi – mid of September or end of September depending on location.

Apply 4 – 7 times a year to your bonsai (every 4 weeks).

AKADAMA types available

if you buy substrate at IBUKI, please let us know, which akadama you prefer for your order.

The one on the right, in the middle or on the left in the photo ? please see photo below. The one on the right side Fired Akadama – Red Akadama is usually used by pros in your country. It is stronger so it can stay in the pot much longer in a cooler and wet weather. Semifired Akadama-Golden Akadama (middle) is also fantastic as it's stronger than Regular Akadama-Doubleline Akadma (left side), it takes the same amount of water and fertilizer and release it to the roots. Recently they sell double line really soft I noticed.

The price is the same.

Please let me know what is better for you.

Ibaraki hard akadama

- Regular - Doubleline akadama type (on the left). It is ok but in the past was much better.

- Semifired - Golden akadama type (in the middle) Best choice for regular use

- Fired - Red akadama type (on the right) that is semifired akadama (more red) that you can keep for 5-6 years in the pot. Best choice if you have a tree that needs to stay longer, for many years in the pot, like all the advanced structure or old trees as well as fresh yamadori trees in development that will stay longer in the pot.

A few comments from bonsai pros about semifired akadama:

Mr Walter Pall:

semifired Akadama .. this is great news. As you and others know I have strong problems with akadama. The main reason is that it is decomposing. Especially in my climate where trees are exposed to frost for many weeks akadama creates big problmes. Often I get trees which are imported from Japan and have not been repotted for some time. They sit in full akadama which is hard like a birck and very difficutl to remove without really disturbing the root ball. I even go so far to call regular akadama dangerous. But I am fully aware of the positvie properties that akadama has. With the firing method this totally changes the situation. If akadama does not decompose anmore I would definitely use it and can only recommend it. In addition I would like to raise another point. It is my conviction that old bnsnai are usully repotted too often. Yamadori trees can and should be undisturbed for ten to twenty years or more. When repotting old collected trees roots should not be cut at all if possible. In this situation the fact that akadama decomposes is unbearable. With noromal akadama one has to repot frequntly which is not my aim. So I suggest to use pumice or lava only for collected trees. Now I can extend this list to semifired akadama. Walter Pall

Doubleline
